

User Flows

Minimal prototype specification | Markdown is the source of truth

1. New member joins

Open shared link -> Sign in -> Enter/accept invite code -> Join group -> Dashboard

- 1 User opens the deployed link or invite link.
- 2 If signed out, the app requests authentication.
- 3 The app shows the invite code from the link or asks the user to enter one.
- 4 User confirms joining.
- 5 The app creates one membership if it does not already exist.
- 6 User lands on the group dashboard.

Failure states:

- Invalid or expired-looking code: show "Group not found" and allow retry. Codes need not actually expire in V1.
- Existing member: do not duplicate membership; open the dashboard.
- Database error: show a retryable message and do not pretend the join succeeded.

2. Admin creates a group

Sign in -> Create group -> Enter name -> Create -> Copy invite link -> Dashboard

- 1 User enters a group name.
- 2 App creates the group with the user as owner.
- 3 App also creates the owner's membership.
- 4 App displays a copyable invite code/link.

3. Admin publishes today's problem

Dashboard -> Add problem -> Enter fields -> Publish -> Dashboard

Required fields: title, valid external URL, difficulty, and date. Platform defaults to LeetCode. Note is optional.

If a problem already exists for that group and date, the app asks the admin to edit it rather than creating a second daily problem.

4. Member completes today's problem

Dashboard -> Open problem externally -> Return -> Mark done -> See updated progress

- 1 Member opens the external problem link in a new tab.
- 2 Member returns after solving it.
- 3 Member selects **Mark done**.
- 4 App creates the member's completion record once.
- 5 Button becomes **Completed** and count/member status update.
- 6 Refresh preserves the completed state.
- 7 Selecting **Undo** removes only that member's completion after confirmation or a clear second action.

5. Member views daily progress

The dashboard shows:

- Today's problem or a clear "No problem posted" state.
- completed members / total active members.
- A simple completed/not completed status for every group member.

Members cannot edit other members' statuses.

6. Member views seven-day progress

Dashboard -> Progress -> Seven-day heatmap

- Rows represent current group members.
- Columns represent the last seven calendar dates, including today.
- A completed problem is shown as completed.
- A posted but incomplete problem is shown as incomplete.
- A date without a posted problem is shown as no problem, not as a failure.
- Values are calculated from problems and completions.

7. Member discusses a problem

Open problem details -> Read comments -> Add short text -> Post

- Comments are plain text, chronological, and linked to one problem.
- Empty or whitespace-only comments are rejected.
- The app shows author name and timestamp.
- No replies, reactions, attachments, editing, or mentions.
- This flow is implemented only after flows 1-6 work.

8. Admin edits or deletes a problem

Only the group owner sees admin actions.

- Edit: open the existing values, validate changes, save, and return to the dashboard.
- Delete: warn that related completions and comments will also be deleted, require confirmation, then show the empty state.

9. Sign out

Account menu -> Sign out -> Login

The session ends and protected group pages no longer reveal group data.
